AETRAA: open issues before launch

7 Oct 2026 · repo github.com/girizz345/AETRAA, branch main, commit 58712db · code in `Girish/AETRAA Platform/work/test-drive` · every change is logged in `CHANGES-test-drive.md`

Where things stand. Ajay's 24 decisions are all built. All 30 unit test files pass, including both PostgreSQL runs. Last complete run of the pre-launch kit (both databases, headless Chrome): **227 pass, 1 fail**. That fail (the HSE log on PostgreSQL) is fixed in 58712db, and the PostgreSQL unit test covers it. A final full kit run on 58712db was stopped part-way: the SQLite half had 100 checks passing and none failing.
How to check: `cd "Girish/AETRAA Platform/work/test-drive" && npm install`, then `node tools/test-*.mjs` (each prints "N checks, 0 failures"). Full kit: `cd ../../prelaunch && node run.mjs --release ../work/test-drive --backend both`. It needs Chrome, takes about 40 minutes, and writes `results/<time>/summary.md`.

1. Code: still to do

	Issue	Priority
1	**Finish the full kit run on 58712db with zero failures.** Run it to the end on both databases. If PostgreSQL shows anything new, it will most likely be a database column that was never created. All bare `ALTER TABLE` statements were converted to `addColumns` in 58712db; keep it that way.	Before launch
2	**Copy the menu entries into `dashboard-design.html`.** `src/html/app.js` is generated from it by `tools/gen-app.mjs`. Since 6 Oct, app.js was edited directly to add: Ask the project, Draft a letter, Delays & EOT, Payment terms, Specification index, Knowledge base, Schedules, Contract obligations, Tender ↔ IFC deviations, Past registers, Incoming / outgoing. Regenerating without copying them over loses them. Ajay is sending the current gen-app.mjs; an older copy is in `_archive/backup-2026-09-21/tools/`.	Before the next regenerate
3	**A DC cannot start a bulk drop from any screen.** `/intake` and `/files` are AETRAA-only; a DC uploads drawings one at a time. Decision 13 (continue your own drop) is built on the server, and the screen side waits on spec D2 (may a DC bulk-load?). Needs Ajay's call.	Ask Ajay
4	**"DC sends the diary if the contract requires it" (v5 A12) is not built.** It was waiting on A4, and A4 contract obligations now exist (`src/obligations.js`). It can be built from an approved obligation.	After launch
5	**Per-project switch for bulk loading (spec §25) is not built.**	Later
6	**Old issue-register RFIs keep their RFI-000x numbers.** New ones are INF-000x and raise an RFI record. Decide whether to renumber or link the old ones on live data.	Later
7	**The older copy of the code at the top of `Girish/AETRAA Platform/`** (`src/`, `server.js`, `local.mjs`) is not what runs and confuses people. Archive or delete it once Ajay agrees. The start files and RUN-LOCALLY.md already point to work/test-drive.	Housekeeping
8	**`tools/run-tests.mjs` (npm test) breaks on Windows**: it builds paths from the URL pathname. Run the test files one by one instead, or fix it with `fileURLToPath` (as done in server.js).	Housekeeping

2. Not testable here: check on the live server after deploy

	What	How to check
9	Sign-in codes by email (Azure Communication Services) and the scheduled sends (18:00 daily, Monday 07:00 weekly, 08:00 on the 1st monthly, 06:00 digest)	Set the ACS connection string. Sign in with one internal address and wait for one scheduled send.
10	Every AI feature (letters, delay notices, RFIs, minutes, diary and photos, A4 obligations, Tender vs IFC, Arabic letters, scan reading)	Set `ANTHROPIC_API_KEY` (approved as D8). Locally only the switched-off path and a fake model are tested.

11	Azure Blob file storage	Ajay to give access; steps in `deploy/azure/STORAGE.md`. Then open `/api/storage`: it must say `working: true`. Until then files are kept in the database, which works.
12	Hosting, DNS, TLS, and the phone app (PWA)	`node run.mjs --live-readonly` after deploy; install on a real phone over HTTPS.
13	Primavera .xer import (kit G13), and Ajay's drawing checks (`p1b-check.mjs`, `authority-check.mjs`)	Need a real .xer and Ajay's Al Warqa'a drawings. authority-check now confirms AI stamp readings (decision 7).
14	Live database	Confirm no company is on the "demo" plan, unless one is wanted (it is listed at /demo). `LOGIN_TEST_CODE` is confirmed off.
15	Image library on the server	`@napi-rs/canvas` is now a declared dependency. After install, a scanned sheet's "Read with AI", the PDF form preview and the Tender vs IFC overlay must work. Without it, each one says so instead.

3. Tested only on generated files: run one real file of each through first

16	A real contract PDF → contract obligations (A4) · a real tender and IFC drawing set → Tender vs IFC · a consultant's PDF form, fillable and flat · an Outlook .msg letter · an Arabic letter · site photos for captions. Also from the K-series work: a Word form (K4), a past log (K6), a returned consultant form (K7), a subcontractor timesheet (K8), a catalogue with spec and material form (K12). Keep each first real file as a test fixture.	

4. Fixed today by the kit (for reference: do not undo)

- IPC full pack (.zip) crashed: K1 had removed `const enc = new TextEncoder()` from `src/ipc-pack.js` · a wrong sign-in code gave a 500 on PostgreSQL: `?1` parameters, fixed in `src/db-postgres.js` · drawing numbering and the HSE log could not be saved on PostgreSQL: columns never added; all now go through `addColumns` · `server.js` could not find schema.sql on a path with a space (`fileURLToPath`) · the kit's G7 now follows decision 11, its seed data was repaired, and it runs on Windows.
